

# YIELDINDICATOR

Improve your herd management decisions by monitoring every animal's milking performance.

## THE COST-EFFECTIVE WAY TO MEASURE MILK VOLUME

The Waikato Milking Systems Yield Indicator is a cost-effective unit that measures your milk volume.

This allows you to monitor every animal's milking performance and make accurate animal yield comparisons to improve your herd management decisions. The Yield Indicator works in conjunction with the milking point controller, by counting and timing milk slugs across the internal probes. Featuring no moving parts and a single long-life gasket, the robust design of the Yield Indicator ensures reliability with low maintenance and operational costs. The unit's ingress protection rating (IP) makes it suitable for use within all milking parlour environments.

By providing you with milk volume data, the Yield Indicator allows you to understand which animals are the highest and lowest performers so you can make more informed management decisions - at an entry level price.

### 3 models available:

**YI2500** Standard yield  
Suits 19mm milk lines  
Suits most bovine parlours

**YI2500XL** For high flow applications  
Suits 22mm milk lines

**YI2500SR** Suitable for small ruminant milking  
(Sheep and Goat)

### Suitable for all milking parlour environments

Options available for cows (high flow) and sheep/goats (low flow), and can be used in low line and high line milking parlours.

### Easy to install, for a long-life

Featuring quality components (durable engineering polymer with a stainless steel bracket) designed for dairy environments.

### Individual animal yield recording

When combined with suitable milking point controller, every animal's milking performance can be monitored.
